CARE JOURNEY DOCUMENTATION

Does your organization struggle with risk adjustment prospective strategy? Do you get the most out of primary care documentation? Are your prospective suspecting and patient clinical workflows supporting your overall risk strategy?

The best way to maximize risk documentation is to get the most out of your primary care network and provide the right nudges to members and providers at the right time. Many health plans face challenges in designing and implementing rigorous prospective risk documentation strategies.

MEMBER SUSPECTING

HDD has developed a comprehensive prospective risk toolkit that includes:

- Prospective suspecting algorithms
- A Patient-level classification tree and workflow model to track every member and maximize documentation at the point of care
- Monthly updates that show project-level or intervention-related impact

HDD can provide a comprehensive solution to your prospective risk strategy through our toolkits and wrap-around consulting services. We can train your staff to use our toolkits or deliver value through full-service analytics.

CLINICAL WORKFLOWS

Our toolkits can be run using standard CMS EDPS files and by claims and enrollment data from your transaction system/data warehouse.

Our approach can be used to:

- Design and implement new initiatives or accurately measure the impacts of current ones
- Create monthly operational and patient lists that can be delivered to clinical, quality improvement, or member engagement teams
- Tune your value-based care contracts to maximize data acquisition
- Implement documentation projects that align with the complex CMS risk calendar

Our comprehensive suite, including the OIG Audit Exposure Accelerator and CMS Risk v28 Modeling, combined with Monthly Risk Forecasting and Reconciliation, empowers you to master your risk data. This integrated approach enhances your ability to deliver improved care to your members.
